

HealthConnect Clinic, Week 8

Project Summary

Data Analytics Track

Prepared by: Hillary Emmanuel | Programme: AnalystLab Africa

1. What I planned to do

Package the validated Week 7 findings into a final decision-support deliverable: the final analytics report and executive summary, final KPIs, presentation slides, and the HC-POD integration record.

2. What I actually did

Built the Final Analytics Report (executive summary, final KPIs, validated findings, key visualisations, business insights, recommendations, the call pilot design, and limitations), a separate presentation slide deck, and a Final Integration Readiness table. Documented the real HC-POD exchange (the DS track collaborator's threshold correction) as a DA-only walkthrough, since this HC-POD is being completed solo.

3. Most important results

All Week 7 findings carried forward unchanged into the final package. The two headline results remain booking lead time as the strongest predictor (27.8% to 67.7% no-show rate) and the double-risk segment (lead time 31+ days and 2+ prior no-shows, 4.66% of bookings, 73.0% no-show rate).

4. Issues or weaknesses identified

The DS track collaborator's merge status for the corrected threshold has not been independently reconfirmed this week.

5. Improvements or refinements made

Consolidated five weeks of testing and validation into a single concise final report and slide deck, rather than adding new analysis. Combined the two Week 8 integration exchanges into one HC-POD record with all nine required fields per exchange.

6. Retesting results

No new retesting was required this week. All Week 7 test results (KPI reproduction, segment tests, the double-risk threshold retest under two model types) carry forward unchanged into the final package.

7. Track(s) collaborated with

The DS track collaborator (final threshold correction).

8. What was tested collaboratively

No new joint test was run in Week 8. The collaborative test itself, checking whether the DS track collaborator's `double_risk_flag` correctly encoded the DA finding, was completed and validated in Week 7 and is finalised here.

9. What changed as a result

The Week 7 correction (double-risk threshold at 31+ days rather than 46+) is now documented as the final, standing definition for both tracks going into project closure.

10. Key findings or validation outcomes

Booking lead time, the double-risk segment, the 15+km distance threshold, and the KPI 5 cancellation-to-no-show pattern are presented as the final, validated set of findings for the HealthConnect

project.

11. Major challenges encountered

No new analytical challenges this week. The main task was condensing five weeks of testing and evidence into a single, concise final package without diluting or overstating what was actually validated.

12. Important decisions made

The HC-POD walkthrough documented as a self-contained DA-only record, since this HC-POD is being completed solo.

13. Remaining limitations

Findings are validated on a single 5,000-row fictional dataset with no held-out or external data. Small subgroups (the 3+ prior no-show bracket, 15+ km patients within individual lead-time bands) carry wider uncertainty. reminder_sent and reminder_channel effects remain less thoroughly tested. The double-risk call pilot is a design only, not yet run.

14. Remaining issues or dependencies

None outstanding at time of submission. The individual video presentation, README update, Google Drive upload, GitHub push, the official submission form, and LinkedIn/X posts were all completed ahead of the deadline.

15. Contribution to the overall HealthConnect project

Data Analytics finalised the decision-support package underpinning the project's business recommendations, and closed out its one real cross-track dependency (the double-risk threshold correction) ahead of final integration.

16. What must be completed before submission

All required Week 8 submission steps were completed before the deadline: the individual video presentation, the README update with Drive and social links, the GitHub push, the official submission form, and the LinkedIn and X posts.
